

# Analysis of the application prospects of carbon dioxide energy storage

Is compressed carbon dioxide energy storage technology a promising prospect?

Compressed carbon dioxide energy storage technology shows a promising prospect due to unique advantages. Considering the remarkable effect of working medium storage mode on the system performance, four compressed carbon dioxide energy systems based on different carbon dioxide storage modes are proposed in this paper.

How to analyze a compressed carbon dioxide energy storage system?

To analyze and evaluate the technical and economic characteristics of the system comprehensively and accurately, it is necessary to study the economic status of the compressed carbon dioxide energy storage system in its entire life cycle, and to compare and analyze the technical and economic aspects of the compressed carbon dioxide energy storage system.

What is compressed carbon dioxide energy storage (CCES)?

They are now characterized as large-scale, long-lifetime and cost-effective energy storage systems. Compressed Carbon Dioxide Energy Storage (CCES) systems are based on the same technology but operate with CO<sub>2</sub> as working fluid. They allow liquid storage under non-extreme temperature conditions.

What is liquid carbon dioxide energy storage (LCES) technology?

For liquid carbon dioxide energy storage (LCES) technology, CO<sub>2</sub> is stored as liquid phase in both HP and LP sides of the system, which has high energy storage density and strong operation stability.

How many types of compressed carbon dioxide energy storage systems are there?

In this paper, four kinds of compressed carbon dioxide energy storage (CCES) systems based on different working fluid storage modes are proposed. Both the thermodynamic and economic performances are analyzed and the most promising development route is indicated.

Why do CO<sub>2</sub> energy storage systems have low compression and expansion ratios?

Most of the existing CO<sub>2</sub> energy storage systems are designed with low compression and expansion ratios to maintain transcritical or supercritical conditions. Consequently, due to the low temperature trend of system heat compression, limited power capacity, and low energy density are anticipated.

In order to solve the problems of intermittency and instability of renewable energy, based on the supercritical compressed carbon dioxide energy storage (SC-CCES) ...

This paper proposes a novel compressed CO<sub>2</sub> energy storage system based on 13X zeolite temperature swing adsorption (TSA). Based on 13X zeolite adsorption gas ...
