

What are the different types of battery energy storage systems?

The different BESS types include lithium-ion, lead-acid, nickel-cadmium, and flow batteries, each varying in energy density, cycle life, and suitability for specific applications.

Why are we legislating electricity storage?

Why are we legislating? Electricity storage covers a range of technologies that store low carbon energy for when it is needed, for example in batteries on the wall of your home or business, or in facilities that pump water to higher reservoirs when electricity is abundant, and let it flow back down through a turbine when it is scarce.

Should electricity storage be formalised as a subset of generation?

Formalising electricity storage as a distinct subset of generation removes current ambiguities and provides long term clarity and certainty over its treatment within the existing frameworks (e.g. planning and licensing) and possible future frameworks.

How can we create a best-in-class regulatory framework for electricity storage?

This focuses on actions to create a best-in-class regulatory framework by removing regulatory and policy barriers to the implementation of storage, ensuring that markets reflect the value of flexibility to the system and investing in innovation. Defining electricity storage in primary legislation is central to this approach.
