

# Can discharge to 0 volt energy storage battery

What happens if a battery is discharged to 0 volt?

When a battery is discharged to 0 V and stored at 0 V, the anode still retained a certain amount of reversible lithium inventory, and the potential rose slowly and was lower than the dissolution potential of Cu (Fig. 9 d-f). The RLE remained nearly 100% capacity retention rate (CRR) after three 3-day zero-volt storage. Fig. 9.

Does draining a battery to 0V destroy them?

Draining them to 0V supposedly does not destroy them, you'd have to keep forcing current through the cell. If a battery is s/c, the partially charged cells will drive the fully discharged cells in reverse. This is bad and may cause leakage, bursting, and, in theory, explosion. cells may be stored s/c.

Can a battery go down to zero volts?

It is safely impossible to drop an ideal battery to zero volts. A battery cannot go down to zero volts because of the internal chemistry. In a standard use, you cannot drop the voltage below 2 volts, even if you wired the terminals together. Batteries will vary between 3.8 and 2.4 volts per cell. As voltage drops, internal resistance rises.

Can You recover a lithium ion battery from zero volts?

Recovering a Lithium-Ion battery cell from zero volts is not recommended, as it can result in a fire. This is because once the cell goes under about 2.5 or 2.6 volts, a chemical reaction occurs inside the cell that permanently damages it and drastically increases its internal resistance.

How much voltage can a battery drop if wired together?

In a standard use, you cannot drop the voltage below 2 volts, even if you wired the terminals together. Batteries will vary between 3.8 and 2.4 volts per cell. As voltage drops, internal resistance rises. The higher the internal resistance, the lower the current over the short circuit.

Can a Li-ion battery be discharged at 3V?

At 3V a Li-ion battery has almost no capacity left. In this graph two 800mAh batteries were discharged at various rates. At 0.1A there was virtually no capacity left at 3.0V. Even at 1A they were 99% discharged. It is safely impossible to drop an ideal battery to zero volts.
