

What is a water cooling plate?

The water cooling plate is made of copper or aluminum with high thermal conductivity. The water circulation system is embedded into the liquid cooling plate, and the electronic components are fixed directly on the water cooling plate.

What is a liquid cooled plate?

Liquid cooled plates are structurally compact and relatively thin plates and strips of metal with fluid channels arranged inside to produce convection heat exchange between the fluid and the liquid cooled plate, thereby dissipating the thermal power of high-power electronic components on the surface of the liquid cooled plate.

How can water cooled plates improve the performance?

We currently have the latest phase change technology on the stability of the water-cooled plate, which can reduce the volume of the product and make the performance more reliable. Welding, ADV conventional water-cooled plates use Vacuum brazing, Friction stir welding and Induction welding.

What welding methods are used in water cooled plates?

Welding, ADV conventional water-cooled plates use Vacuum brazing, Friction stir welding and Induction welding. In addition, we also have Laser Beam Welding, Arc Welding, Percussion Welding, High /Middle /Low Rotary Frequency Welding, to better adapt to your inquiry.

What are cold plate materials?

Materials cold plate materials are usually used aluminum, copper, stainless steel, etc., of which aluminum is the most widely used. Aluminum material density and high thermal conductivity, second to copper, and the cheapest of the three, so the product is cost-effective.

What is a fluid cold plate?

Liquid cold plate is through the structure of compact and relatively thin plate-like, strip metal internal layout of the fluid channel, so that the fluid and cold plate between the convection heat transfer, thereby dissipating the surface of the cold plate high power electronic components of the thermal power consumption.
