

Coal energy storage ratio

What is the energy storage/release ratio?

The overall heat storage/release ratio is approximately 3.43:1. The system's energy storage round-trip efficiency is 73.58%. Compared to using only electrical heating thermal energy storage, this integrated configuration adds 142.34 MWth of thermal energy storage but increases the energy round-trip efficiency by 11 percentage points.

What is the energy storage/release ratio under electric heating TES?

It can be found the maximum energy storage power is 845.58 MWth, the maximum energy release power is 279.65 MWth, and the heat storage/release ratio is approximately 2.92:1. At this point, the system's energy storage round-trip efficiency is 62.65%. Fig. 12. Energy distribution diagram of heat storage/release under electric heating TES. 5.

How does a cycle index affect the deformation of a coal sample?

Notably, the dissipated energy generated during the first cycle at each stress level reaches its peak. With the progression of the cycle index, the deformation of the coal sample gradually stabilizes, reaching a dynamic equilibrium between the energy input during loading and the elastic energy released during unloading.

What is the cyclic energy storage ratio?

As the cyclic process continues, the energy storage ratio of the coal sample progressively increases and stabilizes, reaching a maximum value of 0.9978 and a minimum value of 0.8911, resulting in a range of 0.1067. In contrast, Fig. 8 b reveals an opposite trend for the energy dissipation ratio.

Can thermal energy storage improve load-following capability of coal-fired power plants?

The flexibility transformation of coal-fired power plants (CFPP) is of significant importance for the new power system primarily based on new energy sources. Coupling thermal energy storage (TES) technology is one effective approach to enhance the load-following capability of CFPPs.

What is the average density of a coal sample?

After preliminary testing, the average density of the coal sample is 1294 kg/m³ and the longitudinal wave velocity is 1463 m/s. Test coal sample. The tests were conducted using the MTS816 rock mechanics testing system and the v|tome|x L300 micro-focus CT scanning system.
