What is compressed carbon dioxide energy storage (CCES)?

They are now characterized as large-scale, long-lifetime and cost-effective energy storage systems. Compressed Carbon Dioxide Energy Storage (CCES) systems are based on the same technology but operate with CO<sub>2</sub> as working fluid. They allow liquid storage under non-extreme temperature conditions.

What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) processes are of increasing interest. They are now characterized as large-scale, long-lifetime and cost-effective energy storage systems. Compressed Carbon Dioxide Energy Storage (CCES) systems are based on the same technology but operate with CO<sub>2</sub> as working fluid.

Why do we need compressed air energy storage?

To increase the share of electricity generation from renewable energies for both grid-connected and off-grid communities, storage systems are needed to compensate for their intermittent nature. Compressed air energy storage (CAES) processes are of increasing interest.

How is CO<sub>2</sub> stored?

To store energy, the gaseous CO<sub>2</sub> is compressed to around 70 bar, which heats it to around 400 °C. Passing it through a heat exchanger and a thermal store cools the supercritical carbon dioxide gas enough to liquify it. The liquid CO<sub>2</sub> can be stored in this state indefinitely in pressurised cylinders.

Why is liquid CO<sub>2</sub> more energy efficient than compressed air?

Liquid CO<sub>2</sub> has a much higher energy density (66.7 kWh/m<sup>3</sup>), than compressed air in typical compressed-air energy storage (CAES) systems (2-6 kWh/m<sup>3</sup>), meaning the same energy can be stored in a much smaller volume.

Can CO<sub>2</sub> be stored at ambient temperature?

Liquid carbon dioxide can be stored at ambient temperatures, unlike Liquid air energy storage (LAES), which must keep liquid air cold at -192 °C, though the CO<sub>2</sub> does need to be kept pressurised.
