

How can we model the cost of compressed air energy storage?

We can model the capex costs of Compressed Air Energy Storage from first principles in the model, by combining our models of compressor costs, storage facility costs and turbine costs. Our numbers also match top-down costs reported for past projects and technical papers into CAES.

What is compressed air energy storage?

Compressed Air Energy Storage systems have a large potential to compensate for the fluctuating nature of renewable energies. Energy storage hereby is performed by compressed air in caverns. These caverns can either be drilled in salt and rock formations or already existing cavities such as in aquifer strata.

Which energy storage system has the highest CAPEX cost?

At \$643/kWh, gravity storage had the highest average global capex cost, BNEF said. In non-China markets, installed LDES system costs were 54% higher for thermal energy storage, 66% higher for flow batteries and 68% higher for compressed air storage, BNEF said.

How much does energy storage cost?

Cost data for most technology groups came from projects deployed globally between 2018 and 2024. At \$232/kWh, thermal energy storage was the cheapest technology group, followed by compressed air storage. At \$643/kWh, gravity storage had the highest average global capex cost, BNEF said.

How much does a capex system cost?

Fully installed systems' global average capex costs were \$232/kWh for thermal energy storage and \$293/kWh for compressed air storage, compared with \$304/kWh for four-hour lithium-ion battery storage, according to the report.

Which energy storage technology groups can discharge for 6 hours?

BNEF examined seven energy storage technology groups that can discharge for durations of at least six hours, including compressed air, compressed gas, pumped hydro, thermal, gravity, flow batteries and lithium-ion batteries. Cost data for most technology groups came from projects deployed globally between 2018 and 2024.
