Is energy storage a key technology for achieving the 'dual carbon' goal?

Energy storage is a key technology for achieving the 'dual carbon' goal and the development of energy storage is of high strategic importance. Compared to other storage technologies, the thermodynamic electricity storage technology represented by CAES, CCES and PTES is more suitable for large-scale and long-term storage.

What are the three thermodynamic electricity storage technologies?

In this paper, three thermodynamic electricity storage technologies, namely CAES, CCES and PTES, are comprehensively reviewed. For each technology, the basic principle is firstly clarified and then system structures and storage devices are summarized. Thereafter, the corresponding demonstrations and costs of different routes are sorted out.

What is the cost of CCES and Flywheel energy storage project?

Currently, the most referenced project is the CCES and flywheel energy storage project of Dongfang Electric Corporation. The capacity cost is 1140 \$/kWh, which is higher than that of CAES. Theoretically, the cost of CCES should be equivalent to that of CAES, otherwise CCES is hard to be applied and will be eliminated by the market.

What is thermodynamic energy storage?

Thermodynamic electricity storage adopts the thermal processes such as compression, expansion, heating and cooling to convert electrical energy into pressure energy, heat energy or cold energy for storage in the low period of power consumption, and then convert the stored energy into electrical energy at the peak of electricity consumption.

How many demonstration projects of CCES are there?

At present, there is only one demonstration project of CCES, the technological route is VL-CCES. For other routes, relevant in-depth research and demonstration are very urgent. The technical difficulty and engineering implementation value of various routes must be accurately evaluated.

What are the different types of energy storage systems?

Depending on the form of energy storage, energy storage systems can be categorized into three types which are heat storage technology, cold storage technology and electricity storage technology. While heat and cold energy can be used directly, this is limited to the user side.
