What is thermochemical energy storage?

In this technique, the energy is stored and released in the form of a chemical reaction and is generally classified under the heat storage process. The thermochemical material, used to store thermochemical energy storage, undergoes either a physical reversible process involving two substances or a reversible chemical reaction as given below:

What is thermochemical energy storage (TCES)?

Thermochemical energy storage (TCES) utilizes a reversible chemical reaction and takes the advantages of strong chemical bonds to store energy as chemical potential.

How does thermochemical heat storage work?

Thermochemical heat storage works on the notion that all chemical reactions either absorb or release heat; hence, a reversible process that absorbs heat while running in one way would release heat when running in the other direction. Thermochemical energy storage stores energy by using a high-energy chemical process.

Which materials are used in thermochemical energy storage system?

The working pairs of materials incorporated in thermochemical energy storage system including silica gel/water, magnesium sulfate/water, lithium bromide/water, lithium chloride/water, and NaOH/water have been considered the most prominent materials for achieving increased heat storage capacity.

Can thermochemical energy storage close the energy supply-demand gap?

The thermal energy storage (TES) technology has gained so much popularity in recent years as a practical way to close the energy supply-demand gap. Due to its higher energy storage density and long-term storage, thermochemical energy storage (TCES), one of the TES methods currently in use, seems to be a promising one.

Is thermochemical energy storage reversible?

The thermochemical material, used to store thermochemical energy storage, undergoes either a physical reversible process involving two substances or a reversible chemical reaction as given below: Where  $Q$  is the amount of heat required to dissociate  $A$  and  $B$ .
