How does a circuit breaker work?

A circuit breaker is a switch that protects electrical circuits from damage due to too much current. It works by stopping the flow of electricity when there is an overload or short circuit. A circuit breaker controls the flow of power to an electrical circuit. A circuit breaker should trip when a 125% or more overcurrent happens.

Why is a circuit breaker important?

Circuit breakers keep electrical circuits safe. They stop the flow of electricity when it's too much or dangerous. This prevents damage and fires. These devices are important in homes, businesses, and factories. They come in different sizes and types. How do you fix a breaker that won't reset?

What happens if a circuit breaker trips?

They will eventually change it and replace the wires that damage them. A functioning circuit breaker will stay off after it trips. It will only go on when someone manually turns the breaker's lever to restore the connection. If the breaker immediately trips again, the breaker is either bad or there's an issue with the circuit.
