

Will electric vehicle batteries satisfy grid storage demand by 2030?

Renewable energy and electric vehicles will be required for the energy transition, but the global electric vehicle battery capacity available for grid storage is not constrained. Here the authors find that electric vehicle batteries alone could satisfy short-term grid storage demand by as early as 2030.

Why was EV battery demand downgraded?

In BNEF's most recent Electric Vehicle Outlook, expected EV battery demand over the next four years was downgraded due to lower outlooks in markets like Germany, Italy and the US compared to previous iterations of the report.

Can EV batteries supply short-term storage facilities?

For higher vehicle utilisation, neglecting battery pack thermal management in the degradation model will generally result in worse battery lifetimes, leading to a conservative estimate of electric vehicle lifetime. As such our modelling suggests a conservative lower bound of the potential for EV batteries to supply short-term storage facilities.

Is EV battery demand rising?

Global energy storage installations -- including residential, commercial and utility scale -- account for a growing share of total battery demand, rising from 6% in 2020 to an expected 13% this year. Put another way, the ratio of EV battery demand to stationary battery demand has fallen from 15-to-1 to 6-to-1 over the last four years.

How will EV batteries help the energy transition?

Provided by the Springer Nature SharedIt content-sharing initiative The energy transition will require a rapid deployment of renewable energy (RE) and electric vehicles (EVs) where other transit modes are unavailable. EV batteries could complement RE generation by providing short-term grid services.

Do EV batteries degrade over time?

Over time EV batteries degrade to the point they cannot be used to power vehicles ²⁷, generally when the battery's relative State of Health (SoH) drops below 70%-80% ⁷ (defined as actual capacity as percentage of original capacity).
