

Can energy storage batteries be recycled?

Existing technology and infrastructure for battery recycling can absorb energy storage batteries (both in terms of chemistry and volumes) - . Investment likely to be required to achieve 95% recovery rate. Some anecdotal evidence that batteries are being sent to Sri Lanka and India with PV panels (for sorting and re-use).

How much of a battery is recyclable?

4. How much of the battery is actually recyclable? Redwood's technology can recover, on average, more than 95% of materials like nickel, cobalt, copper, aluminum, lithium and graphite in a lithium-ion battery. These materials can then go directly back into the supply chain to make batteries for new electric vehicles and energy storage products.

Is battery recycling economically viable?

Although batteries are costly to collect and process, battery recycling is likely to need less support to be economically viable because collection of energy storage batteries in NSW will likely benefit from emerging recovery pathways for LIB from a range of other applications.

Are energy storage batteries a waste?

Waste from energy storage batteries remains low in the short term, as batteries have only been installed in NSW within the last 5 years and in small numbers. Over the time period of this study battery waste is much lower than PV waste.
