

How does a solar energy storage inductor work?

In this topology, the energy storage inductor is charged from two different directions which generates output AC current. This topology with two additional switching devices compared to topologies with four switching devices makes the grounding of both the grid and PV modules. Fig. 12.

What is the rate of energy storage in a Magnetic Inductor?

Thus, the power delivered to the inductor $p = v \cdot i$ is also zero, which means that the rate of energy storage is zero as well. Therefore, the energy is only stored inside the inductor before its current reaches its maximum steady-state value, I_m . After the current becomes constant, the energy within the magnetic becomes constant as well.

How does an inductor work?

The inductor behaves like a load and stores energy to prevent ripples from producing excess current. It acts like a current supply when the ripple reduces the current value. In each case, the inductor prevents the ripples from influencing the regulated DC.

How does Linear Technology affect inductor energy storage?

While one inductor's current is increasing, the other's is decreasing. There is also a significant reduction in the required inductor energy storage (approximately 75%). The inductor's volume, and therefore cost, are reduced as well. See Linear Technology's Application Note 77 for complete details.

Why is an inductor lossless?

Without the internal resistance, the inductor is lossless because it cannot produce heat or light from the available energy. Therefore, all the energy supplied by the source ends up being stored in the generated magnetic field - exactly how energy is stored in rubber bands when stretched.

What are the characteristics of a practical inductor?

The exponential characteristics of a practical inductor differ from the linear behavior of ideal inductors; both store energy similarly - by building up their magnetic fields. These magnetic fields have undesirable effects on the inductors and nearby conductors, causing several safety hazards.
