

Why is capacity expansion modelling important in energy-system decarbonization?

As grid planners, non-profit organizations, non-governmental organizations, policy makers, regulators and other key stakeholders commonly use capacity expansion modelling to inform energy policy and investment decisions, it is crucial that these processes capture the value of energy storage in energy-system decarbonization.

Which energy storage sources are used in electric vehicles?

Electric vehicles (EVs) require high-performance ESSs that are reliable with high specific energy to provide long driving range. The main energy storage sources that are implemented in EVs include electrochemical, chemical, electrical, mechanical, and hybrid ESSs, either singly or in conjunction with one another.

How can auxiliary energy storage systems promote sustainable electric mobility?

Auxiliary energy storage systems including FCs, ultracapacitors, flywheels, superconducting magnet, and hybrid energy storage together with their benefits, functional properties, and potential uses, are analysed and detailed in order to promote sustainable electric mobility.

What are energy storage technologies for EVs?

Energy storage technologies for EVs are critical to determining vehicle efficiency, range, and performance. There are 3 major energy storage systems for EVs: lithium-ion batteries, SCs, and FCs. Different energy production methods have been distinguished on the basis of advantages, limitations, capabilities, and energy consumption.

What is capacity expansion modelling (CEM)?

Capacity expansion modelling (CEM) is often used by system planners, resource developers, policy makers and researchers to evaluate different electricity system pathways and to balance the trade-offs in satisfying several objectives, including (1) eliminating carbon emissions, (2) ensuring affordability and (3) maintaining system reliability.

What are the characteristics of energy storage system (ESS)?

Use of auxiliary source of storage such as UC, flywheel, fuel cell, and hybrid. The desirable characteristics of an energy storage system (ESS) to fulfill the energy requirement in electric vehicles (EVs) are high specific energy, significant storage capacity, longer life cycles, high operating efficiency, and low cost.
