

What is an energy storage system?

An energy storage system is something that can store energy so that it can be used later as electrical energy. The most popular type of ESS is a battery system and the most common battery system is lithium-ion battery.

Can a residential energy storage system be UL 9540a certified?

No. In order to achieve a UL 9540 certification or listing, a residential energy storage system must meet the unit level performance criteria of UL 9540A when the spacing between individual battery energy storage systems is less than 3 ft (0.9 m) in accordance with the installation codes (NFPA 855, IRC).

Can energy storage systems be installed in certain areas?

Energy storage systems can pose a potential fire risk and therefore shouldn't be installed in certain areas of the home. NFPA 855 only permits residential ESS to be installed in the following areas:

What is an energy storage system (ESS)?

Covers an energy storage system (ESS) that is intended to receive and store energy in some form so that the ESS can provide electrical energy to loads or to the local/area electric power system (EPS) when needed. Electrochemical, chemical, mechanical, and thermal ESS are covered by this Standard.

What is a battery energy storage system?

Battery energy storage systems (BESS) stabilize the electrical grid, ensuring a steady flow of power to homes and businesses regardless of fluctuations from varied energy sources or other disruptions. However, fires at some BESS installations have caused concern in communities considering BESS as a method to support their grids.

How many kWh can you put in a garage?

In all other locations noted above, the size limit is 80 kWh. On the exterior walls of the home, it's important to note that systems cannot go within 3 feet of doors or windows leading directly into the home. And as we will soon discuss, code compliance for ESS in an attached garage can be much more complicated than systems in a detached garage.
