

# How much does pge pay per kwh for solar

How much does PG&E cost per kWh?

The first and most basic PG&E tariff schedule to consider is the Tiered Rate Plan, also known as E-1, in which the cost of electricity is dictated by your usage during the billing period. For example, as of January 2024, electricity costs 42 cents per kWh until you reach your monthly Baseline Allowance, and then the price jumps to 53 cents per kWh.

How do PG&E Solar rates work?

PG&E's solar rates are basically our regular rates with Net Energy Metering (NEM) on top. NEM means we subtract the solar power you generate from your total electricity usage for a given period, then charge or credit you based on the difference between the two. Start your service online, and then call 1-877-743-4112, Monday - Friday...

What is PG&E's electric home rate plan?

As a solar customer, you are automatically enrolled in PG&E's Electric Home rate plan. This Time-of-Use rate plan includes a \$15-per-month Base Services Charge that lowers the price you pay per unit of energy (kWh), on average, compared to other Time-of-Use rates. Click here for more information on the Electric Home rate plan and ways to save.

How much electricity does PG&E pay per day?

For PG&E customers, the Baseline Allowance is based on four things: So, if you live in Santa Cruz (Territory "T") and have basic electric service, your baseline allowance for summer months would be 6.5 kWh per day (based on this chart). In a 30-day month like June, that amounts to 195 kWh.

How much does PG&E electricity cost in California?

The average single-family homeowner on the E-1 Residential rate plan from PG&E territory pays \$400 per month for electricity or about \$4,800 per year. With California electricity prices increasing by 4.1% per year on average, you could end up paying \$140,000 or more over the next 20 years in electricity bills.

How much does a PG&E Solar System cost?

The net cost of installing a PG&E solar system for a typical single family homeowner with a power bill of \$270 a month and a 9.32kW system is \$16,571. The estimated cost before incentives is \$23,673, or \$2.54 per watt. Upfront incentives, including the 30% federal solar tax credit, reduce this cost by \$7,102.

Most of the cost is for infrastructure. The value you are providing by your solar is only a small fraction of the overall charge. In California, we're practically swimming in solar ...

Compensation for excess generation through Net Surplus Compensation (NSC) is set by the California Public
