What is water consumption in a cooling tower?

The water consumption consists on the control of the make-up water, the blowdown water and the evaporated water quantities. These three waters determine the cycles of concentration that can be reached in the cooling tower. The mass balance of a cooling tower system can be written as the following:

What is the water consumption of an open circuit cooling tower?

Figure 1 - scheme of open circuit cooling tower The water consumption consists on the control of the make-up water, the blowdown water and the evaporated water quantities. These three waters determine the cycles of concentration that can be reached in the cooling tower.

Does a cooling tower need an overflow alarm?

Most green codes require overflow alarms. The water used by the cooling tower is equal Cooling tower to the amount of make-up water that is added to the system. The amount of make-up water needed is dictated by the amount of water that is lost from the cooling tower through evaporation, drift, blowdown, and leakage, as illustrated by Equation 6-3.

How to conserve water in cooling tower operations?

Carefully monitoring and controlling the quantity of blowdown provides the most significant opportunity to conserve water in cooling tower operations. Blowdown can be conducted manually using a batch method, in which blowdown is initiated, and make-up water is fed to the system for a preset time to decrease the concentration of TDS.

What are the different types of cooling towers?

These uses require large amounts of water and often present potential for water saving. This savings result in lower water and sewer bills and decreased treatment costs. In the industrial market there can be found three types of cooling towers: open circuit, closed circuit and once through system.

What is a cycle of concentration in a cooling tower?

Moreover, the cycles of concentration is a ratio of the concentration in suspended solids between the blowdown water and the make-up water. This ratio can be optimized by controlling the cooling tower make-up water (click in new page) quality and the reused cooling tower blowdown (click in new page) quality.
