

How to configure energy storage capacity based on electricity bill

What determines the optimal configuration capacity of photovoltaic and energy storage?

The optimal configuration capacity of photovoltaic and energy storage depends on several factors such as time-of-use electricity price, consumer demand for electricity, cost of photovoltaic and energy storage, and the local annual solar radiation.

What is the optimal energy storage configuration capacity when adopting pricing scheme 2?

The optimal energy storage configuration capacity when adopting pricing scheme 2 is larger than that of pricing scheme 0. By the way, pricing scheme 0 in Fig. 5 (b) is the electricity price in Table 2.

How is energy storage life determined?

The energy storage life is also determined by the actual operation strategy of energy storage; and in order to determine the operation strategy of energy storage, the configuration capacity of photovoltaic and energy storage must be given first.

What is the value of a user side energy storage system?

In recent years, many scholars have carried out extensive research on user side energy storage configuration and operation strategy. In [1] and [2], the value of energy storage system is analyzed in three aspects: low storage and high generation arbitrage, reducing transmission congestion and delaying power grid capacity expansion.

What is the energy storage capacity of a photovoltaic system?

The photovoltaic installed capacity set in the figure is 2395kW. When the energy storage capacity is 1174kWh, the user's annual expenditure is the smallest and the economic benefit is the best. Fig. 4. The impact of energy storage capacity on annual expenditures.

Does energy storage capacity affect annual comprehensive cost?

The annual comprehensive cost is positively related to energy storage capacity when adopting pricing scheme 1, namely when the peak-to-valley price difference shrinks to a certain extent, consumers cannot obtain economic benefits by configuring energy storage.
