Do energy storage systems work in industrial parks?

Currently, various energy storage systems, particularly heat and electricity storage, operate independently in industrial parks. Typically, stored thermal energy is not used to electricity generation.

What are the characteristics of industrial parks?

Industrial parks are characterized by varying levels of development, diverse industrial structures, and a high concentration of enterprises, resulting in significant concentrated and concentrated demands for electricity, heat, and other energy sources .

How important is heat & electricity in industrial parks?

According to the IEA's Renewables 2019 Analysis and Forecast to 2024 report, heat accounted for 50 % of global final energy consumption in 2018, underscoring the equal importance of heat and electricity. Efficiently converting stored heat to electricity in industrial parks remains a significant challenge.

What is thermal energy storage?

and 12% of total GHG emissions in the EU. Thermal energy storage (TES) can assist in the decarbonisation of industrial heating and cooling, and at the same time increase energy system flexibility and security.

Can a Carnot battery convert stored heat to electricity in industrial parks?

Efficiently converting stored heat to electricity in industrial parks remains a significant challenge. The Carnot battery, functioning as both an energy storage system and an electro-thermal integration system, offers a promising solution for DES.

How TEs can be used in industrial thermal processing?

This white paper briefly outlines the energy consumption involved in industrial thermal processing, and the working principles of different TES technologies. It explains how TES can be integrated into industrial thermal processes and how it can assist industrial decarbonisation, energy system flexibility and security.
