

Interpretation of the policy on home grid energy storage

Is energy storage a distinct asset class within the electric grid system?

The authors support defining energy storage as a distinct asset class within the electric grid system, supported with effective regulatory and financial policies for development and deployment within a storage-based smart grid system in which storage is placed in a central role.

What role does energy storage play in a smart grid?

Asset class position and role of energy storage within the smart grid As utility networks are transformed into smart grids, interest in energy storage systems is increasing within the context of aging generation assets, heightening renewable energy penetration, and more distributed sources of generation .

How do grid operators use energy storage?

Currently, grid operators would use strategies, such as back-casting (using historical data to predict economically desirable deployment schedules) to apply energy storage. This strategy does not completely capture arbitrage value due to near time weather and usage variations (only 85%) .

How does the Energy Policy Act affect smart metering?

In the United States for instance, the country's Energy Policy Act of 2005 promotes the development of smart meters and for that matter smart grid, as the Act directs all utilities in the country to consider time-based rate schedule and time-based metering upon the request of customers .

What are the different types of energy storage policy?

Approximately 16 states have adopted some form of energy storage policy, which broadly fall into the following categories: procurement targets, regulatory adaptation, demonstration programs, financial incentives, and consumer protections. Below we give an overview of each of these energy storage policy categories.

How does a smart grid work?

Smart grid coupled with energy storage systems increases demand elasticity while also disconnecting the simultaneity of production and consumption. Together, these services balance supply and demand while allowing a continual increase of renewables on the grid.
