Can dynamic ice storage improve energy flexibility in subtropical climates?

This paper introduces an innovative dynamic ice storage system based on ice slurry designed to shift electricity demand and improve energy flexibility for consumers in subtropical climates, thereby reducing energy consumption and contributing to decarbonization.

What is dynamic ice cooling?

As a type of thermal energy storage, or phase change energy storage, ice storage has the characteristics of safety, long life, and controllable cost. Additionally, dynamic ice cooling has an extremely fast cooling rate and can consider heat storage in winter, making it extremely suitable for energy storage and cost-effective HVAC systems.

Is dynamic ice storage more energy-efficient than traditional cooling systems?

The proposed system was implemented in a high-rise office building in southern China and analyzed through energy, environmental, and economic perspective. On-site measurements demonstrate that the dynamic ice storage system is significantly more energy-efficient and has lower carbon emissions than traditional cooling systems.

What is the energy balance of dynamic ice storage systems?

While the energy balance primarily focuses on the active charging and discharging phases of the dynamic ice storage system, potential standing losses (e.g., thermal dissipation and idling losses) were not explicitly measured or modeled due to data limitations.

What is dynamic ice storage system?

Another category is dynamic ice storage system, in which the ice is periodically generated in a refrigeration device and transferred to an independent storage tank. The previously stored energy is retrieved by recharging the storage tank with water flowing through ice to provide chilled water to the system during normal operations.

What is ice-based thermal energy storage?

Or follow us on Google News! Ice-based thermal energy storage systems have a long history dating back to the zero emission, pre-electric days of the ice house. Carbon emissions entered the mix when people figured out how to deploy electricity to turn water into ice. Now the circle has come around again.

It can be found that the melting of ice in ice storage equipment during the peak electricity consumption period, i.e., 9:00-20:00, and the cooling load are met by the refrigeration unit and ...
