Are hydrogen and metal hydrides used in energy storage?

The paper summarizes Energy Storage (ES) methods that use hydrogen and Metal Hydrides (MH). It highlights the findings of the research and development efforts in this field. The emphasis is on carefully choosing MH materials, namely AB<sub>5</sub>- and AB<sub>2</sub>-type intermetallic substances, for Hydrogen Storage (HS) and compression activities.

What is hydrogen storage?

Hydrogen production from renewables via electrolysis, different storage possibilities and subsequent utilization for heating, mobility, industry and power. A storage technology with potential for different applications is hydrogen storage via absorption in metal hydrides.

What are the advantages of hydrogen storage in metal hydrides?

The main advantage of hydrogen storage in metal hydrides for stationary applications are the high volumetric energy density and lower operating pressure compared to gaseous hydrogen storage. In Power-to-Power (P2P) systems the metal hydride tank is coupled to an electrolyser upstream and a fuel cell or H<sub>2</sub> internal combustion engine downstream.

Does absorption-based storage of hydrogen in metal hydrides offer high volumetric energy densities?

Absorption-based storage of hydrogen in metal hydrides offers high volumetric energy densities as well as safety advantages. In this work technical, economic and environmental aspects of different metal hydride materials are investigated.

How is hydrogen stored in metal hydrides?

Mechanisms of storage of hydrogen in metal hydrides. Absorption/desorption of hydrogen with transition metals can occur easily at elevated temperatures. After the hydriding process, the metal lattice expands approximately 2.3 Å<sup>3</sup> per hydrogen atom. Electrochemical approaches are used to assess the performance of hydrogen storage.

How much hydrogen is stored in a MH storage system?

The amount of stored hydrogen is in the 30-60 kg range. With typical gravimetric capacities of interstitial low-pressure metal hydride storage systems of 1-1.5 wt%, the MH storage system weights between 3 and 5 t, leaving 20-25 t for cargo.
