How to calculate power generation cost after installation of energy storage facilities?

The power generation cost of new energy units after the installation of energy storage facilities is as follows:

$$(7) C_{NS} = M + P_n \cdot Q + S_b + S_{op} = M + P_n \cdot \min\{q, f(q)\} \cdot d + S_b + S_{op} \quad (8) S_b = R \cdot Q_{str}, S_{op} = N + K \cdot Q \quad (9) Q = Q_{max} - Q_{min}$$

Why should energy storage facilities be installed?

For new energy units, proper deployment of energy storage facilities can promote the consumption of excess generation, increase the option of selling electricity in the high price period, participate in the competition auxiliary service market, and improve the return on total life cycle assets.

What is the integrated model for energy storage?

How does energy storage affect the cost of energy storage?

When new energy units are equipped with energy storage facilities, the cost of energy storage is hedged against the total amount of penalty, and the output power range increases, so the curve moves from B1 to B3.

How much money did energy storage companies raise in 2022?

In 2022, they accounted for 90% of global energy storage-related fundraising deals (China for 46%, the US for 31%, and Europe for 13% respectively), raising USD 2.9 billion, USD 2 billion, and USD 800 million, respectively (Figure

Which energy storage projects have a low utilisation co-efficient?
