How AA-CAES system is integrated with a high-temperature thermal energy storage system?

The schematic diagram of the proposed AA-CAES system integrated with a high-temperature thermal energy storage system and an ORC: (a) charging and (b) discharging. As illustrated in Fig. 1 a, during the energy storage process, air enters CP1-CP4 and IC1-IC4. Then, the generated high-pressure air is stored in the ASC.

How efficient is a diabatic compressed air energy storage (AA-CAES) system?

A roundtrip efficiency of 65.7 % and an exergy efficiency of 78 % can be gotten. Parameter sensitivity analysis is conducted to optimize system performance. Advanced diabatic compressed air energy storage (AA-CAES) system has drawn great attention owing to its large-scale energy storage capacity, long lifespan, and environmental friendliness.

How much compressed air does a STCs system use?

As shown in Table 5 since the energy charging process remains unchanged, the total compressed power consumption WCP of the proposed system with different STCS storage media is consistently 9190 kWh, indicating an equal storage amount of compressed air across all cases.

What is compressed air energy storage (CAES)?

In the continuous development and production operation of the past 50 years, compressed air energy storage (CAES) has become a large-scale physical energy storage technology in addition to pumped storage, with the largest capacity, mature technology and commercialization.

What happens when a compressed air storage tank is full?

During energy storage process, when the compressed air storage tank is about to be full, by converting an amount of compressed air to liquid air can still draw electrical energy from the grid. During energy release process, when the compressed air storage tank is to be empty, the liquid air storage tank provides air.

Why do thermal energy storage units not reach a high temperature?

However, due to constraints related to compressor efficiency, structure limitations, and the effectiveness of heat exchangers, the thermal medium in the thermal energy storage unit, which relies on compression heat, cannot reach sufficiently high temperature .
