How much does a commercial battery energy storage system cost?

Average Installed Cost per kWh in 2025 In today's market, the installed cost of a commercial lithium battery energy storage system -- including the battery pack, Battery Management System (BMS), Power Conversion System (PCS), and installation -- typically ranges from: \$280 to \$580 per kWh for small to medium-sized commercial projects.

How are energy storage systems priced?

They are priced according to five different power ratings to provide a relevant system comparison and a more precise estimate. The power rating of an energy storage system impacts system pricing, where larger systems are typically lower in cost (on a \$/kWh basis) than smaller ones due to volume purchasing, etc.

How much does a PCS cost?

For a 2MW system, if we assume a PCS cost ratio of 15%, and the total system cost excluding the PCS is \$890,000 (the sum of the battery, BMS, and EMS costs), the cost of the PCS would be $\$890,000 * 0.15 = \$133,500$. The cost of the PCS can also vary depending on its power rating, efficiency, and the quality of the components used. 5.

What are base year costs for utility-scale battery energy storage systems?

Base year costs for utility-scale battery energy storage systems (BESSs) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2023). The bottom-up BESS model accounts for major components, including the LIB pack, the inverter, and the balance of system (BOS) needed for the installation.

What are the different types of energy storage systems?

The survey methodology breaks down the cost of an energy storage system into the following categories: storage module, balance of system, power conversion system, energy management system, and the engineering, procurement, and construction costs.

Are battery electricity storage systems a good investment?

This study shows that battery electricity storage systems offer enormous deployment and cost-reduction potential. By 2030, total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better combinations and reduced use of materials.
