Are battery electricity storage systems a good investment?

This study shows that battery electricity storage systems offer enormous deployment and cost-reduction potential. By 2030, total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better combinations and reduced use of materials.

Should energy storage be included in the electric grid?

Integrating storage in the electric grid, especially in areas with high energy demand, will allow clean energy to be available when and where it is most needed. As New York continues to invest and build a cleaner grid, energy storage will allow us to use existing resources more efficiently and phase out the dirtiest power plants.

How has policy support for EVs changed over the last year?

Policy support for EVs in the US has changed significantly over the last year. These include elements of the Inflation Reduction Act that are being removed or threatened, as well as the potential removal of California's ability to set its own emissions standards. BNEF's outlook for US EV adoption has decreased as a result.

What is the future of electric transport?

Electrification is spreading quickly in other areas of road transport, with buses and two- and three-wheelers already reaching very high levels of adoption. Note: All figures are BloombergNEF's outlook for 2025. Percentages are the share of new sales in each segment. Includes battery electrics and plug-in hybrids.

Are EV sales slowing down?

Global sales of electric vehicles continue to rise and are set to represent one in four cars sold this year. But some markets are experiencing a significant slowdown, and many automakers have pushed back their EV targets.
