

Pwm energy storage capacitor is too small

Can a capacitor be charged with a PWM frequency?

As i understand capacitors,wouldnt it be charged with each rising edge of the pwm frequency? which also means the capacitor is charged with the peak voltage. Yes,the voltage does fall on the other half of the pwm. But still,the capacitor is charged with 5V,so basically it would give a rough sawtooth voltage.

How can a PWM rectifier compensate for pulsating ripple power?

Generally,the PWM rectifier suffers from pulsating ripple power at double the supply frequency. This unwanted power can be filtered out by selecting a large value of capacitor or an LC branch. To compensate for ripple energy in this system a Proportional Integral controller(PI controller) is proposed.

Does voltage fall on the other half of a PWM?

Yes,the voltage does fall on the other half of the pwm. But still,the capacitor is charged with 5V,so basically it would give a rough sawtooth voltage. The larger the capacitor,the lesser (word?) the voltage falls between each peak. so what is happening in here?

What's the difference between a power supply and a PWM circuit?

The power supply is a COTS 'black box' figuratively and literally - I don't have a schematic. The PWM circuit is also COTS, however I can see that it is very simply a mosfet in between the load v- and supply v-, v+ is common. No other components in the path, probably a terrible design. The load is a high wattage LED strip.

How can a PWM rectifier boost DC output voltage & unity power factor?

It can boost DC output voltage and unity power factor at sinusoidal inputwith small THD (Total Harmonic Distortion). Generally,the PWM rectifier suffers from pulsating ripple power at double the supply frequency. This unwanted power can be filtered out by selecting a large value of capacitor or an LC branch.

What are the characteristics of a PWM rectifier?

According to power circuit connections,PWM rectifiers can be categorized into two configurations,the current and voltage. In a current type rectifier,the supply peak value should be greater than the rectified output voltage. The rectifying dc voltage is adjusted starting at zero,which is the most important characteristic.
