

Rated voltage of energy storage cell

What is rated energy storage capacity EC_n?

Rated energy storage capacity EC_n derived from open-circuit voltage at BOL. For empty state, initial charge voltage the symbol V_{Bat,empty,initial,C} is used (V_{Bat,empty,initial,C} > 0). The charge current rate can also be added in the index.

How do you calculate energy storage capacity?

Energy storage capacity of a cell or battery can be calculated by using (actual charge) capacity C and battery open-circuit voltage v_{Bat,OCV}(t) between full and empty state: $E_C = \int_{SOC=0}^{SOC=100\%} q(SOC) dq$ Energy storage capacity is usually expressed in kilo watt hours (kWh).

What is usable energy storage capacity EC_{use}?

Usable energy storage capacity EC_{use} The usable energy storage capacity (or 'usable energy capacity') is the energy storage capacity of a cell or a battery which can be used under certain operational conditions. For usable energy storage capacity the sign EC_{use} shall be used.

What is rated battery discharge efficiency?

4.10. Rated battery discharge efficiency $\eta_{D,n}$ Typically rated battery discharge efficiency $\eta_{D,n}$ is determined at beginning of life (BOL) and for certain conditions specified by battery manufacturer. So rated battery discharge efficiency can be determined during rated capacity verification test and may be used as battery acceptance criterion.
