

Recycling for all solid-state lithium-ion batteries

Can lithium ion batteries be recycled?

Today's recycling processes for lithium-ion batteries (LIBs) allow recovery rates of over 90% for nickel, cobalt and copper, but achieving a similarly high rate for lithium recovery remains a challenge. Additionally, electrolytes have rarely been recycled.

Are all solid-state batteries recyclable?

Here, we developed a sustainable design and scalable recycling strategy for next-generation all solid-state batteries (ASSBs). We use the EverBatt model to analyze the relative energy consumption and environmental impact compared to conventional recycling methods.

Is battery recycling sustainable?

A scalable battery recycling strategy to recover and regenerate solid electrolytes and cathode materials in spent all solid-state batteries, reducing energy consumption and greenhouse gases. With the rapidly increasing ubiquity of lithium-ion batteries (LIBs), sustainable battery recycling is a matter of growing urgency.

Does solid-state battery recycling lag behind lithium-ion batteries?

Recycling spent batteries is crucial for a circular battery economy, yet knowledge of solid-state battery (SSB) recycling lags behind that of lithium-ion batteries. This study evaluates SSB recycling techniques, emphasizing the need for specific, energy-efficient methods tailored to distinct electrolytes.

Can ceramic all-solid-state batteries be recycled?

Schwich, L. et al. Recycling strategies for ceramic all-solid-state batteries--Part I: study on possible treatments in contrast to Li-ion battery recycling. *Metals* 10, 1523 (2020). This study shows the first possibilities for the recycling of oxide-based solid-state batteries, in particular the hydrometallurgical processing of LLZO.

Are solid-state batteries the future for lithium-ion batteries?

All solid-state batteries (ASSBs) are expected to be the future for lithium-ion batteries (LIBs). However, recycling aspects for ASSBs are underexplored and would be critical as supply/demand projections will eventually result in unprecedented amounts of disposed LIBs, especially from the automotive sector.

Furthermore, an overview of possible approaches in relation to their challenges and opportunities for the recycling of solid-state batteries with respect to different solid-state ...

Here, we developed a sustainable design and scalable recycling strategy for next-generation all solid-state batteries (ASSBs). We use the EverBatt model to analyze the relative energy ...

Solid-state batteries (SSBs) have emerged as a promising alternative to conventional lithium-ion batteries,

Recycling for all solid-state lithium-ion batteries

with notable advantages in safety, energy density, and longevity, yet the environmental implications of their life ...

We further propose a general design for ASSB recycling, utilizing hydrometallurgy and direct recycling methods. Finally, we discuss the value of legislation and ...

However, so far, the development of sustainable recycling strategies allowing for an efficient backflow of critical elements contained in these batteries into the economic cycle ...

All-solid-state lithium batteries (ASSBs) have emerged as a promising alternative to conventional lithium-ion batteries, offering the potential for improved safety, higher energy ...

Abstract Lithium (Li)-based batteries are gradually evolving from the liquid to the solid state in terms of safety and energy density, where all solid-state Li-metal batteries ...

The tremendous efforts made in the research field of solid-state Li-ion batteries have led to considerable advancement of this technology and the first market-ready systems can be expected in the near future. The research ...

Abstract Abstract: All-solid-state thin film lithium batteries (TFBs) are regarded as the ideal power source for microelectronics in the upcoming era of the Internet of Things, owing to their solid ...

6 · The electrolytes in most lithium-ion batteries are highly flammable and degrade over time into toxic byproducts that require specialized handling. To simplify the recycling process, ...

Lithium-ion battery (LIB) recycling is critical given the continued electrification of vehicles and mass generation of spent LIBs. However, industrial-level recycling is hampered ...

Finally, the review presents a forward-looking perspective to outline impending challenges and avenues for research to fully realize direct recycling for LIBs/all-solid-state ...

With the current global projection of over 130 million electric vehicles (EVs), there soon will be a need for battery waste management. Especially for all-solid-state lithium-ion ...

Here, we developed a sustainable design and scalable recycling strategy for next-generation all solid-state batteries (ASSBs). We use the EverBatt model to analyze the relative energy consumption and environmental impact compared ...

Intensive energy consumption, long leaching time and low leaching efficiency remain key problems in sustainable recycling of solid electrolytes (SSEs) from all-solid-state lithium-ion ...

Recycling for all solid-state lithium-ion batteries

All-solid state lithium-ion batteries are suitable candidates for high energy density mobile and grid-storage energy applications. It is important to develop a strategy to obtain metals back used in their synthesis, either as pure ...

The recovery of spent lithium batteries not only has benefits for the environment and resources, but also shows great potential application in all-solid-state lithium batteries, ...

Based on these considerations and with reference to previous research, it will be shown that different solid-state electrolytes will require individually adapted recycling processes to be suitably designed for a circular ...

All-Solid-State Lithium-Ion Battery (ASSLIB) is a trending topic in battery research. Even though they are not commercialized yet, the expectations regarding the performance of ASSLIBs are quite high.

Check for updates Solid-state batteries (SSBs) are expected to provide higher energy densities, faster charging performance and greater safety than lithium-ion batteries (LIBs).

A scalable battery recycling strategy to recover and regenerate solid electrolytes and cathode materials in spent all solid-state batteries, reducing energy consumption and greenhouse gases. With the rapidly increasing ...

Table 1 provides a comparison of solid-state batteries (SSBs) and conventional lithium-ion batteries (LIBs) across various aspects, including technology, advantages, challenges, and environmental impacts.

Based on these considerations and with reference to previous research, it will be shown that different solid-state electrolytes will require individually adapted recycling processes ...

Solid-state batteries have long been touted as the next big thing in energy storage, offering higher energy density, faster charging times, and enhanced safety compared to traditional lithium-ion batteries. However, one of ...

Replacing the liquid electrolytes with inorganic solid materials with high lithium-ion conductivity has given birth to a new class of Lithium-Ion Batteries (LIBs) known as All-Solid-State Lithium ...

Lithium-ion battery (LIB) recycling is critical given the continued electrification of vehicles and mass generation of spent LIBs. However, industrial-level recycling is hampered by a variety of factors that make large-scale ...

This study explores the complexities and potential of recycling all-solid-state Li-ion batteries based on argyrodite sulfide solid electrolytes through a dissolution-based separation strategy. It examines the impact of

Recycling for all solid-state lithium-ion batteries

solvent ...

We for the first time use green deep eutectic solvents to recover solid electrolytes from all-solid-state lithium-ion batteries with high efficiency and high Li/La ...

This study explores the complexities and potential of recycling all-solid-state Li-ion batteries based on argyrodite sulfide solid electrolytes through a dissolution-based separation ...

6 · The electrolytes in most lithium-ion batteries are highly flammable and degrade over time into toxic byproducts that require specialized handling. To simplify the recycling process, the researchers decided to make a more ...

The current state of LIB recycling is inadequate, and the incorporation of lithium-metal anodes and solid electrolyte chemistries in ASSBs will pose additional challenges. Therefore, recycling ...

We for the first time use green deep eutectic solvents to recover solid electrolytes from all-solid-state lithium-ion batteries with high efficiency and high Li/La selectivity at mild temperature.

Abstract All-solid-state lithium-ion batteries (ASSLIBs) are anticipated to be the next generation of high-performance lithium batteries due to their enhanced safety and high ...
