

# Regulations on the management of base station energy storage batteries

What is a battery management standard?

A new standard that will apply to the design, performance, and safety of battery management systems. It includes use in several application areas, including stationary batteries installed in local energy storage, smart grids and auxiliary power systems, as well as mobile batteries used in electric vehicles (EV), rail transport and aeronautics.

What is a battery energy storage system (BMS)?

This document considers the BMS to be a functionally distinct component of a battery energy storage system (BESS) that includes active functions necessary to protect the battery from modes of operation that could impact its safety or longevity.

What is a battery management system?

The battery management system is considered to be a functionally distinct component of a battery energy storage system that includes active functions necessary to protect the battery from modes of operation that could impact its safety or longevity.

How to classify the safety of storage battery?

One of the methods to classify the safety of storage battery is by hazard level, as shown in Table 1. According to the concept that safety is inversely proportional to abuse, gives the definition and calculation method of safety state of energy storage system.

What is a battery standard?

Covers requirements for battery systems as defined by this standard for use as energy storage for stationary applications such as for PV, wind turbine storage or for UPS, etc. applications.

Why is battery energy storage a safety problem?

Due to the "short board effect", the available capacity of BESS will decrease, resulting in failure. Therefore, with the emergence of the scale effect of battery energy storage, the safety problem has become a new risk challenge faced by the development of energy storage. We should pay attention to the safety risk management in time.
