

Relationship between energy storage device working flow and time

What is the operation process of power flow regulation and shared energy storage?

The operation process of power flow regulation and shared energy storage of bus 1 after obtaining the solution to the bilevel optimization operation model is depicted in Fig. 9. During the periods of 01:00-05:00 and 23:00-24:00, the load is jointly supplied by the power flow transfer and the superior power grid.

Why do energy storage devices need to be able to store electricity?

And because there can be hours and even days with no wind, for example, some energy storage devices must be able to store a large amount of electricity for a long time.

How does energy storage work in distribution systems?

Energy storage predominantly occurs through hydrogen storage and electrochemical energy storage, while energy is consumed across various types of electrical load demand systems. Figure 1. Energy flow in distribution systems. Figure 2 depicts the overall flowchart of optimizing energy storage planning, divided into four steps.

How can flexible shared energy storage improve the energy consumption capacity?

After connecting the buses 1-4 to the flexible shared energy storage equipment, the source load matching optimization of the four lines corresponding to the buses can be coordinated through the flexible shared energy storage, which can significantly improve the consumption capacity for the newly generated energy.

How energy storage and non-fault side power grid regulated power flow?

In this mode, the power flow can be regulated by the energy storage or non-fault side power grid through the FESPS to ensure uninterrupted power supply. In addition, the energy storage and non-fault side power grid could jointly realize uninterrupted power supply for the load.

How can energy storage capacity be fully released?

Subsequently, a method involving a bilevel optimization model was adopted: by replacing the original energy storage capacity at each end of the source, grid, and load with the FESPS, the energy storage capacity was fully released.
