

Requirements for using solar energy storage to access the grid

What are the different storage requirements for grid services?

Examples of the different storage requirements for grid services include: Ancillary Services - including load following, operational reserve, frequency regulation, and 15 minutes fast response. Relieving congestion and constraints: short-duration (power application, stability) and long-duration (energy application, relieve thermal loading).

What standards are required for energy storage devices?

Coordinated, consistent, interconnection standards, communication standards, and implementation guidelines are required for energy storage devices (ES), power electronics connected distributed energy resources (DER), hybrid generation-storage systems (ES-DER), and plug-in electric vehicles (PEV).

How can a battery energy storage system maximise the use of solar energy?

To maximise the use of the solar energy that is available some hours of the day, the electricity production from the panels must exceed the needs in that period, so that excess can be stored and utilised later, until the sun shines again. This is possible with battery energy storage systems (BESS).

How can IREC simplify the interconnection process for solar-plus-storage projects?

IREC is leading a team of partners to simplify the interconnection process for standalone energy storage and solar-plus-storage projects. The BTRIES project will address key barriers to storage interconnection and identify solutions to enable the rapid deployment of storage on the distribution grid.

Will electric storage play a larger role in Islanded systems?

Eventually electric storage will play a larger role in islanded systems by helping to stabilize generation and load variations. Island system applications do provide some early examples of the stabilizing support needed when renewables are added to islanded (weak electrical) systems. Various types of ES-DER systems are emerging.

How does a grid-connected system work?
