

# Sodium hydrogen energy storage for energy storage vehicles

How much hydrogen can a hydrogen storage system deliver?

In order to develop a weight and volume density estimate, we characterized a sodium hydride-based hydrogen storage system designed to deliver 4.09 kg of hydrogen (a vehicle range requirement of 380 miles and a fuel efficiency of 93 miles per kg of hydrogen).

How does a sodium hydride storage system work?

These balls are sliced open one at a time onboard the vehicle to deliver hydrogen as needed. We estimate a sodium hydride-based storage system can achieve a hydrogen storage density of 4.3 wt% and 47 kg/m<sup>3</sup>, including all ancillary equipment. PowerBall Technologies, LLC is also developing a novel method of manufacturing the sodium hydride material.

Will a sodium hydride storage system heat up during vehicle operation?

Because the reaction {1} is strongly exothermic, the storage system will likely heat up during vehicle operation. We estimate the sodium hydride storage system will increase the onboard cooling duty by 100% and increase the weight of the radiator system by 75%.

Can hydrogen be stored on a motor vehicle?

The low energy density per unit volume of hydrogen makes storing and transporting gas a significant research and technical challenge. Consequently, storing hydrogen on a motor vehicle is a key technology enabling the development of hydrogen and fuel cell technologies [3,4]. Figure 1.

How is hydrogen used in the automotive industry?

Most of the development work focused on the powertrain and its integration into the vehicle. Currently, one of the key technologies that determines the development of the automotive industry are on-board hydrogen storage systems. Without efficient storage systems, the using of hydrogen to drive motor vehicles will be difficult to achieve.

What are the performance targets for light-duty hydrogen storage systems?

To address all challenges of hydrogen storage systems, performance targets for light-duty vehicles were developed by the U.S. Department of Energy (DOE) assuming an estimated mileage of circa 500 km. The goals set by the DOE, which are presented in Table 2, determine the research directions of most research centres.
