How much does thermal energy storage cost?

In our base case, the cost of thermal energy storage requires a storage spread of 13.5 c/kWh for a 10MW-scale molten salt system to achieve a 10% IRR, off of \$350/kWh of capex costs. Costs are sensitive to capex, utilization rates, opex, electricity prices and round trip losses. The sensitivities can be stress tested in the data-file.

What is thermal energy storage?

Shifting consumer preference toward adaptive, efficient, and durable centralized cooling system have urged the deployment of thermal energy storage across the HVAC applications. Moreover, the thermal energy storage technology is being widely used for comfort cooling owing to growing demand for climate-controlled buildings.

How do thermal energy storage solutions work?

Thermal energy storage solutions aim to help integrate solar and wind into power grids, by absorbing excess generation that would otherwise be curtailed, and then re-releasing the heat later when renewables are not generating. Different storage media are compared in one of the back-up tabs of the model.

Are molten salt systems suitable for thermal energy storage?

Different storage media are compared in one of the back-up tabs of the model. However, one-third of the companies in our thermal energy storage company screen are pursuing molten salt systems, hence our thermal energy storage model focuses on this option.
