

What is a solid-state battery?

Currently, in particular the automotive industry is focusing on the solid-state battery for electric vehicles. New materials and manufacturing processes are needed for the development of rechargeable batteries based on solid-state technology, in which solid instead of liquid electrolytes are used.

How are solid-state batteries produced?

A generally applicable and established process chain to produce solid-state batteries does not yet exist. Instead, many different production processes can be used. The required production volumes and methods depend primarily on the processed solid-state electrolyte. The three electrolyte classes (oxide-based, sulfide-based and polymer-based).

How to advance solid-state battery production?

To advance solid-state battery (SSB) production, significant innovations are needed in electrodes, electrolytes, electrolyte/electrode interface design, and packaging technology. Optimizing these processes is crucial for the manufacturing and commercialization of SSBs.

How do solid-state batteries work?

The working principle of solid-state batteries (SSBs) is similar to that of conventional liquid electrolyte-based batteries, with the key difference being the use of solid-state electrolytes, as illustrated in Fig. 2 (a & b). These solid electrolytes facilitate the movement of lithium ions from the anode to the cathode.

What are the three main processes involved in battery manufacturing?

Battery manufacturing involves three primary processes: (1) electrode production, (2) cell production, and (3) cell conditioning. All of these processes will be altered for solid-state batteries and are highly dependent on the material properties of the solid electrolyte.

How long does a solid state battery take to form?

It is expected that for solid-state batteries, one cycle is sufficient to complete the forming process. In the next step the cell is monitored for several days under controlled conditions to identify damaged cells. Finally, some characterization tests are performed to prove the quality of the cell.
