

How can regenerative braking improve urban rail traction networks?

The integration of photovoltaics (PVs), regenerative braking (RB) techniques, and energy storage devices has become crucial to promote energy conservation and emission reduction for a sustainable future of urban rail traction networks (URTNs).

Can solar energy be used in urban rail traction networks?

Driven by the pressing need for carbon neutrality in the energy-transportation nexus, integrating renewable energy sources such as solar energy into the urban rail traction network (URTN) can reduce its traction energy consumption and enhance the critical role of URTs in sustainable development (Simoiu et al., 2021).

Can urtns be integrated with distributed PV-RB Hess?

In this paper, a tri-level multi-time scale energy management framework is proposed for the economic and low-carbon operation of URTNs integrated with distributed PV-RB HESSs.

Is a madrl-based multi-time scale energy management framework suitable for urtns?

In this paper, a MADRL-based multi-time scale energy management framework is proposed for economic and low-carbon operations of URTNs with distributed PV-RB HESSs. The contributions are summarized as follows:

Why are urban rail transits important?

1. Introduction Urban rail transits (URTs) have become essential transportation infrastructure in densely-populated urban regions worldwide due to their social and economic benefits in providing convenient and sustainable mass transit services (Xiao et al., 2020).

Is urtn a multi-time scale energy management framework?

A tri-level multi-time scale energy management framework is proposed for optimal synergies of URTN operation with solar generation to minimize the overall cost.

In this paper, an energy management strategy based on the urban rail transit energy storage system is proposed based on the impact of ...

DOI: 10.1109/TVT.2021.3100412 Tao, Capacity configuration method of urban rail energy storage system based on NSGA-II and simplified energy storage model, ?. 1 Wang, Improved multi ...

Abstract The integration of urban rail transit (URT) traction networks (TNs) with hybrid energy storage systems (HESSs) has become technologically and socioeconomically ...

Global concern about the energy crisis and its environmental impact has focused on sustainable alternatives. The electric railway system (ERS) is a major electrical energy ...

The deployment of wayside energy storage system (ESS) in urban rail transit (URT) facilitates the efficient utilization of regenerative braking energy of trains, making it a ...

This paper proposes a tri-level multi-time scale energy management framework for the economic and low-carbon operation of URTNs with PV-RB hybrid energy storage ...

Aiming at the problem of high energy consumption in rail transit transportation, this paper studies and analyzes the capacity configuration and energy optimization of rail energy storage systems.

Abstract: In recent years, the introduction of Energy Storage System (ESS) into rail transit has increased the ratio of regenerative energy recovery. However, the investment of ...

This paper first illustrates the composition, topologies and applications of the hybrid energy storage system. Then various energy management strategies of the on-board ...

Abstract: To smooth out voltage fluctuations in the traction network of urban rail trains, a power dynamic allocation strategy based on a soft actor-critic (SAC) with reinforcement learning is ...

The modeling complexity of the traction power system and variation of traffic conditions bring challenges for the optimization of energy management strategy for ...

Therefore, the proposed MOGOA is applied to the capacity configuration problem of the urban rail hybrid energy storage systems (with ground batteries and on-board ...

This paper first illustrates the composition, topologies and applications of the hybrid energy storage system. Then various energy management strategies of the on-board hybrid energy ...

Energy management is an important link in the effective functioning of hybrid energy storage systems (HESS) within urban rail trains. This factor significantly impacts the ...

The integration of photovoltaics (PVs), regenerative braking (RB) techniques, and energy storage devices has become crucial to promote energy conservation and emission reduction for a ...

After that, the existing power quality problems in the electrified railway system with energy storage system and its control strategy are analyzed. Finally, some typical ...

Many multimodal propulsion architectures and energy management strategies are detailed. The analysis also

comprises alternative ...

Thus, the key contribution of this paper is the comprehensive review and analyses of the ESS's components in the recovery of RBE in urban railways. Keywords: Energy Saving; Energy ...

To minimize the comprehensive cost of AC urban rail transit, Chen et al. coordinated the battery and supercapacitor and optimized the sizing of hybrid energy storage ...

A hybrid energy storage system comprising a supercapacitor and battery, which can satisfy the high energy and power requirements of urban rail trains and maintain the voltage stability of ...

Management of regenerative energy becomes a key for enhancing railway operation. This paper presents a strategy for utilizing regenerative energy in urban railway ...

Sizing and Energy Management of On-Board Hybrid Energy Storage Systems in Urban Rail Transit Giuseppe Graber¹, Vincenzo Galdi¹, Vito Calderaro¹, Antonio Piccolo¹

This is a repository copy of Bi-level optimization of sizing and control strategy of hybrid energy storage system in urban rail transit considering substation operation stability.

Integrating renewable energy sources into railway systems presents a promising solution to mitigate rising CO₂ emissions, growing energy demands, and environmental degradation. This ...

With the increasing energy consumption of urban rail transportation, the on-board hybrid energy storage system, which integrates various energy storage technologies, ...

From a system-level perspective, the integration of alternative energy sources on board rail vehicles has become a popular solution among rolling stock manufacturers.

This paper presents a comprehensive overview of the currently available strategies and technologies for recovery and management of braking energy in urban rail, ...

As a result, a high tendency for integrating onboard energy storage systems in trains is being observed worldwide. This article provides a detailed review of onboard railway systems with ...

This paper proposes a hierarchical optimization energy management strategy (EMS) considering speed profile to explore energy-saving potential and achieve a reasonable ...

This thesis reports using reinforcement learning (RL) as a machine-learning base technique to develop three different levels of energy management and configuration ...

Complementing these findings, studies employing multi-agent deep reinforcement learning approaches have advanced the management of photovoltaic and regenerative braking hybrid ...

In response to the insufficient integration of traction power supply regulation and train operation regulation in URS, which cannot fully tap into the energy-saving potential of ...

In this paper, a variable gain K iterative learning control (K-ILC) is proposed to balance the DC regulated voltage characteristics and the optimal lifetime of the battery storage ...
