Can energy storage be a strategic investment under competition?

These market dynamics serve as a motivation for this study to understand strategic investments in energy storage under competition, taking into account storage impact on the market price. Our work uses energy arbitrage as a test case with the intent to explore additional services in the future.

Does the energy storage strategic plan address new policy actions?

This SRM does not address new policy actions, nor does it specify budgets and resources for future activities. This Energy Storage SRM responds to the Energy Storage Strategic Plan periodic update requirement of the Better Energy Storage Technology (BEST) section of the Energy Policy Act of 2020 (42 U.S.C. § 17232 (b) (5)).

What are the different storage technologies in power grids?

When it comes to the economics of different storage technologies in power grids, there have been substantial works on one single technology, e.g., the Li-ion batteries, flow batteries, and compressed air energy storage.

Why is energy storage important?

Energy storage is the key supporting technology to achieve the "30-60" target and energy revolution, and the development of energy storage is of great strategic significance.

How does energy storage work?

First, energy storage usually has a low operation cost since no fuel is directly consumed. Then, the profit-seeking investors will always charge the storage at the lowest prices during the day. To get non-negative revenue, the investor's cost from charge must be no higher than the market revenue from the discharge (at high prices).

Are investors allowed to deploy different energy storage technologies?

Investors are allowed to deploy different energy storage technologies. Analytically, we show that an increasing number of investors will increase the market competition thereby reducing profits while increasing the total capacity of storage deployed.
