What is a knife switch?

A knife switch provides a clear, manual disconnect by physically moving a blade into or out of fixed contacts on an insulating base. Originally used for simple low-voltage isolation, today's knife switches often include arc chambers and safety interlocks to safely interrupt load currents and prevent accidental re-closure.

What is the difference between a knife switch and a disconnect switch?

GRL's knife switches and disconnect switches provide reliable electrical isolation in high-voltage environments. Knife switches are manual switching devices that ensure the safe isolation of electrical circuits, while fuse disconnect switches ensure full separation of electrical connections, especially under load conditions.

What is a fuse knife switch?

Our fuse knife switch products combine fuse protection with knife switch functionality, offering a compact solution for disconnecting circuits while ensuring fast overcurrent protection. These switches are designed to operate in harsh environments, with high reliability and safety.

What are the different types of knife switches?

Among them, there are single-throw knife switches (HD series), double pole double throw knife switches (HS series), which are also knife changeover switches, fused knife switches (HR series), etc., and we will not explain them one by one.

Does a copper knife switch need an arc extinguishing device?

The copper knife switch used for power isolation generally does not need an arc extinguishing device, unless there is a requirement for the knife switch to break the load current, an arc extinguishing device, such as a fast blade or an arc extinguishing chamber, needs to be installed.

What are energy storage fuses?

Fuses act as a safeguard, preventing damage to components by disconnecting power when current exceeds safe levels. GRL DNESS series energy storage fuses are specifically designed for high-energy applications, such as energy storage systems and critical power supplies.
