

What is the principle of superconducting circulating current energy storage

What is superconducting magnetic energy storage?

Superconducting magnetic energy storage is mainly divided into two categories: superconducting magnetic energy storage systems (SMES) and superconducting power storage systems (UPS). SMES interacts directly with the grid to store and release electrical energy for grid or other purposes.

How does a superconducting coil store energy?

First, some materials carry current with no resistive losses. Second, electric currents produce magnetic fields. Third, magnetic fields are a form of pure energy which can be stored. SMES combines these three fundamental principles to efficiently store energy in a superconducting coil.

What are the components of superconducting magnetic energy storage systems (SMES)?

The main components of superconducting magnetic energy storage systems (SMES) include superconducting energy storage magnets, cryogenic systems, power electronic converter systems, and monitoring and protection systems.

Are superconducting energy systems the future of energy?

As early as the 1960s and 70s, researchers like Boom and Peterson outlined superconducting energy systems as the future of energy due to their extremely low power losses. Over time, this vision has evolved into two main technological pathways: Superconducting Magnetic Energy Storage (SMES) and superconducting flywheel energy storage systems.

How does a superconductor store energy?

The Coil and the Superconductor The superconducting coil, the heart of the SMES system, stores energy in the magnetic field generated by a circulating current (EPRI, 2002). The maximum stored energy is determined by two factors: a) the size and geometry of the coil, which determines the inductance of the coil.

When did superconducting magnetic energy storage start?

In the 1980s, breakthroughs in high-temperature superconducting materials led to technological advances. In the 1990s, the rapid expansion of China's power system, power safety became a national priority, and superconducting magnetic energy storage began to be applied because of its superior performance.
