Are battery energy storage systems safe aboard ships?

In recent months, Gard has received numerous inquiries about the safe transportation of battery energy storage systems (BESS) aboard ships. This article addresses some of the key risks, regulatory requirements, and recommendations for shipping such cargo.

Does SCU have a lithium battery energy storage system container certification?

Recently, SCU successfully obtained the UN3536 certification for lithium battery energy storage system container.

What are the different types of energy storage systems?

These systems consist of multiple devices assembled into a single unit capable of storing significant amounts of energy. Among the various types of energy storage systems (ESS), BESS are the most prevalent, especially those utilizing pre-assembled lithium-ion battery modules.

What is a containerized lithium battery energy storage system?

SCU's containerized lithium battery energy storage system adopts a modular design, with the characteristics of high energy density and high efficiency. It can be widely used in various scenarios such as industrial and commercial energy storage, renewable energy grid connection, microgrid and off-grid power systems.

What factors should be considered when transporting Bess?

When transporting BESS on bulk carriers and general cargo vessels, the following factors should be considered: Securing Arrangements and Cargo Spaces: If the vessel lacks adequate securing arrangements, modifications may be necessary under expert supervision, requiring Administration approval.

Should you keep a minimum SOC during transportation?

Regulatory bodies like EMSA and AMSA recommend maintaining a minimum SoC during transportation to mitigate risks. Despite most BESS incorporating inbuilt battery management and cooling systems, thermal runaway incidents can still occur. Most units are designed to vent from the top.
