

Why can a cellar be used to store potatoes

How do you store a potato?

There's more than one way to store a potato. Below are five options you can try out until you find what works best for you. The traditional method for storing potatoes is to put them in a cool, dark place where they aren't at risk of freezing - like a root cellar.

How do you store potatoes in a root cellar?

Storing potatoes in a root cellar provides ideal conditions for long term storage. Most potatoes will store best in a cool dark place. They prefer temperatures of around 50 to 55 degrees Fahrenheit. Since the ground temperature at depths of 15 to 20 feet matches this it makes underground storage an ideal location for potatoes.

What temperature should potatoes be stored?

Potatoes are best kept around 45 to 50 degrees, which means they shouldn't be stored in the fridge or freezer. The best place to store them for maximum shelf life is a cool basement or garage--as long as it's dry. That's not always practical, so if you store potatoes in the kitchen, keep them away from the stove or the heater.

How long do potatoes last in a cellar?

Considering that most cellars are dry and dark, you can rest assured that your potatoes will stay fresh and edible even after a few months. However, if you don't have a root cellar, an insulated garage or a basement can be a good alternative for storing potatoes for the winter.

How long do potatoes last at room temperature?

Kept in a cool, dark place (around 45 to 50 degrees), potatoes will likely last up to three months! At room temperature (around 68 degrees), you can store your potatoes for about two weeks. What are the signs a potato has gone bad, you might be wondering?

Do you wash potatoes before storing?

Don't wash before storing. Keep your potatoes dry. Any additional moisture can lead to mold growth and premature spoiling. If your potatoes are particularly dirty, gently brush off excess soil with a dry cloth or a soft brush. Store in a cool, dark place.
