

Working principle of booster station of energy storage power station

How many mw can a power station produce?

The power station can produce 1,200 MW(=4 units *300 MW/unit) of hydropower and regulate storage capacities of about 8.5 million m³ and 8.7 million m³ in upstream and downstream reservoirs, respectively. The upstream reservoir possesses an emergency reserve storage of 0.5 million m³ to tackle emergency incidents.

What is pumped-storage power (PSP) station operation?

Pumped-storage power (PSP) station operation, known for its critical role in power grid system management, including load peak-shaving, load valley filling, frequency modulation, phase modulation, and emergency backup, holds great importance ..

How to calculate residual power load in PSP station?

Considering the PS-VF operation of PSP station, the residual power load is obtained by utilizing the total power load to subtract the sum of pumped-storage output, hydropower load, wind power load, photovoltaic power load, biomass power load, energy input outside the region and energy input within the region.

How can a PSP station reduce residual power load in summer?

In China, over 50 % of annual streamflow appears in summer. The PSP station can efficiently utilize surplus water volume for regulating the load peak and valley of the grid system to reduce the variability of residual power load in summer. Fig. 5.

What are the stable statuses of a power generation unit?

The stable statuses of four units consist of power generation, pump storage, phase modulation and machine halt (Table 2). In general, units cannot operate in the phase modulation for a long time under pump storage status. Rotating backup for power generation cannot be substituted by unit idling or phase modulation in power generation.

How can Goa improve pumped-storage power station operation?

Optimize pumped-storage power station operation considering renewable energy inputs. GOA optimizes peak-shaving and valley-filling operation of pumped-storage power station. Promote synergies of hydropower output, power benefit, and CO₂ emission reduction. Facilitate the development of PSP station systems and a low-carbon economy.
