

Working principle of the fan in the battery compartment of the energy storage power station

Does fan direction control improve cooling performance of battery packs?

Cooling performance of battery packs under different design options. In summary, the thermal management strategy based on fan direction control proposed in this paper has significant advantages when thermal management of battery pack groups in energy storage battery systems is performed.

Can a battery container fan improve air ventilation?

The existing thermal runaway and barrel effect of energy storage container with multiple battery packs have become a hot topic of research. This paper innovatively proposes an optimized system for the development of a healthy air ventilation by changing the working direction of the battery container fan to solve the above problems.

What happens if a fan is in a suction state?

This shows that when all the fans are in the suction state, it leads to self-locking of airflow between the fans and the energy storage battery container. The fan in this arrangement is in an inefficient operating condition and the battery pack heat dissipation is poor. Fig. 8. Fan flow direction of Initial scheme. Fig. 9.

Does a reciprocating cooling system reduce the non-uniformity of a battery?

The results showed that the reciprocating cooling system reduced the non-uniformity of the battery pack and the maximum temperature of the battery. However, the reciprocating flow system cannot satisfy the energy storage system with a dense battery arrangement and large battery capacity.

What are the characteristics of a battery storage system?

The internal resistance remains unchanged during battery discharge [38, 39]; (3) The walls of the container do not transfer energy and matter to the outside world, and are considered adiabatic and non-slip wall; (4) The source of cooling air is stable and continuous, and the energy storage system operates under stable conditions.

What is the corresponding heat generation power of a battery?

The inlet boundary is a velocity inlet of 2.6 m/s and the outlet boundary is a pressure outlet of 0 Pa. In addition, the temperature of the supply airflow is 293.15 K. The battery has a discharge rate of 0.5C and an internal resistance of 0.3m². Using Bernardi's theory, the corresponding heat generation power of the battery is 1132.91 W/m³.

The containerized storage battery compartment is separated by a bulkhead to form two small battery compartments with a completely symmetrical arrangement. The air ...
