Why do energy storage devices need to be able to store electricity?

And because there can be hours and even days with no wind, for example, some energy storage devices must be able to store a large amount of electricity for a long time.

What are the different types of energy storage systems?

Batteries. Similar to common rechargeable batteries, very large batteries can store electricity until it is needed. These systems can use lithium ion, lead acid, lithium iron or other battery technologies. Thermal energy storage. Electricity can be used to produce thermal energy, which can be stored until it is needed.

How can storage help balance electricity supply and demand?

One way to help balance fluctuations in electricity supply and demand is to store electricity during periods of relatively high production and low demand, then release it back to the electric power grid during periods of lower production or higher demand. In some cases, storage may provide economic, reliability, and environmental benefits.
